

5.3 Configure PAM

List of content

- [5.3.1 Ensure password creation requirements are configured \(Scored\)](#)
- [5.3.2 Ensure lockout for failed password attempts is configured \(Not Scored\)](#)
- [5.3.3 Ensure password reuse is limited \(Scored\)](#)
- [5.3.4 Ensure password hashing algorithm is SHA-512 \(Scored\)](#)

Description

PAM (Pluggable Authentication Modules) is a service that implements modular authentication modules on UNIX systems. PAM is implemented as a set of shared objects that are loaded and executed when a program needs to authenticate a user. Files for PAM are typically located in the `/etc/pam.d` directory. PAM must be carefully configured to secure system authentication. While this section covers some of PAM, please consult other PAM resources to fully understand the configuration capabilities.
